

LOW-DOSE RADIATION THERAPY

A safe, non-invasive treatment option for pain and inflammation from Osteoarthritis.

Low-Dose Radiation Therapy (LDRT) is a safe and non-invasive option for treating osteoarthritis when other methods — like medications, injections, or physical therapy — haven't provided enough relief. It uses very low doses of radiation to target inflamed joints and reduce pain. Benefits include:

Non-Invasive — less possible side effects from medications or surgery

Shorter Treatment Time — as little as one-two weeks, with each treatment lasting about 10 minutes

High Success Rate — many patients experience immediate pain relief after initial course of treatment

Reduced Pain and Inflammation — LDRT has a strong anti-inflammatory effect that can relieve pain, reduce the need for steroid injections, and improve mobility

Cost-Friendly — LDRT is covered by Medicare and many commercial insurance plans

A Trusted and Highly-Experienced Team

Our board-certified specialists are experts in LDRT — creating a personalized treatment plan for each patient. Our team is dedicated to providing compassionate care throughout the process.
